Glycolysis can be divided into two phases: energy consuming (also called chemical priming) and energy yielding. The first phase is the energy-consuming phase, so it requires two ATP molecules to start the reaction for each molecule of glucose. However, the end of the reaction produces four ATPs, resulting in a net gain of two ATP energy molecules.

The urea cycle (also known as the ornithine cycle) is a cycle of biochemical reactions that produces urea ( $\text{NH}_2$ )<sub>2</sub> CO from ammonia ( $\text{NH}_3$ ). This cycle occurs in ureotelic organisms. The urea cycle converts highly toxic ammonia to urea for excretion. This cycle was the first metabolic cycle to be discovered (Hans Krebs and Kurt Henseleit, 1932), five years before the discovery of the TCA cycle.

### **Urea cycle - Wikipedia**

The U.S. Department of Energy's (DOE) Building Technologies Office (BTO) Advanced Building Construction with Energy-Efficient Technologies & Practices (ABC) FOA supports research and development of solutions that can be applied to many segments of the building sector, including existing and new buildings, residential and commercial, and across multiple climate zones.

Where does malaria transmission occur? For malaria transmission to occur, conditions must be such so that all three components of the malaria life cycle are present: Anopheles mosquitoes, which are able to feed on humans, and in which the parasites can complete the "invertebrate host" half of their life cycle; Humans, who can be bitten by Anopheles mosquitoes, and in whom the parasites ...

In the mature stage of a thunderstorm, the warmed air continues to rise until it reaches an area of warmer air and can rise no farther. Often this 'cap' is the tropopause. The air is instead forced to

spread out, giving the storm a characteristic anvil shape. The resulting cloud is called cumulonimbus incus. The water droplets coalesce into larger and heavier droplets and freeze to become ice ...
