Like anything else, there is rarely a definitive answer to the subject question, rather a lot of gray area. Frequently, a model could be constructed in 1D or 2D and provide excellent answers either way. In this case, the experience of the modeler with 1D modeling or 2D modeling becomes very important.

A node is usually referred to by its order  $i$  in the set  $N$ . In a undirected graph, each of the links is defined by a couple of nodes  $i$  and  $j$ , and is denoted as  $(i, j)$  or  $|ij$ . The link is said to be incident in nodes  $i$  and  $j$ , or to join the two nodes; the two nodes  $i$  and  $j$  are referred to as the end-nodes of link  $(i, j)$ . Two nodes joined by a link are referred to as adjacent or neighboring.
