Two trigonometry codebreakers that both involve a terrible joke. The first one is with right-angled triangles, the second requires the sine rule, cosine rule and area of a triangle using trigonometry.

Trigonometry Angles--Pi/2. By the definition of the functions of trigonometry, the sine of is equal to the -coordinate of the point with polar coordinates , giving . Similarly, , since it is the -coordinate of this point. Filling out the other trigonometric functions then gives

Derivation of the Law of Sines: To calculate side or angle lengths of right triangles, you can set up a trigonometric ratio using sine, cosine, or tangent. However, if the triangle does not include a right angle, these basic trigonometric ratios do not apply. Triangles that do not have a right angle are called oblique triangles. Although the basic trig ratios do not apply, they can be modified ...

Note: in many places, I will mention algebraic identities. For serious students who are either algebra-deficient or have to use the material under time pressure, I highly recommend working through "all of the plausible forms" and memorizing them.
